

3D DIGITAL MOCKUPS

Newstyle's Pre-Press department have recently upgraded our front end RIP software installing the latest FUJIFILM Workflow XMF. Using this new technology we are able to output a 3D digital proof of the printed product which can be viewed on any PC or MAC that has standard JAVA software installed.

Going forward Newstyle will provide you the client with these .jar files for you to check for page order, orientation and content. High res proofs will still be provided for colour and content final sign off. Hard copy bond mockups can still be provided upon request or where the job is too complex to output a 3D digital mockup.

Follow the instructions below to view the Java files.

- Copy the .jar file to your desktop and double click.
- Ignore the installation window.
- Wait for the window to open and then maximise the window.
- Hold down the mouse button and move the mouse to rotate the document.
- Hold down the shift key and the mouse button and move the mouse left or right as required to flip the pages.
- Release the mouse button and move to the next page and repeat to flip through the document.
- Hold down the control key and mouse button and move the mouse up to zoom in and down to zoom out.

When finished close the main window and installation window if necessary.

Some computers will not have Java software installed. If this is the case, use a search engine and download the free software and install on your MAC or PC.
